

Reading Super Signals, Best Pairs and SUPERHOT

25 Sep 2026 · Sampath

Which panel is which

Super Signals and Best pairs show the signal desk's paper-traded signals; SUPERHOT, HOT and CMDTS are live market scans. None of them buys anything by itself: taps open the BUY ticket, which still waits for you to confirm.

Panel	Where it sits	What feeds it	How fresh
Super Signals	Tradier Platform: right rail, first panel. 36 Trade Desk: SIGNALS	The signal desk: 8 strategy agents on one 5-minute feed, plus the watchlist tracker	Every 60 s from 08:15 to 15:20 CST, every 10 min otherwise
Best ticker + signal pairs	The "Best ticker + signal pairs" link at the foot of Super Signals, in both worlds	The daily report's 30-session pair list	Once a day, after the 15:00 CST report
SUPERHOT	Tradier Platform: left rail, above HOT. 36 Trade Desk: HOT	A sweep of 100 large caps on Tradier bars, period-9 DMI	Re-swept about every 5 min in market hours
HOT	Directly under SUPERHOT	The same sweep, period-14 DMI	The same sweep
CMDTS	Left rail. 36 Trade Desk: COMMODITIES	GLD, SLV and USO on 1, 2 and 5-minute bars	Every 60 s

Only an armed auto-trader buys on its own. Its super signals and best pairs strategies read the first two panels; the scans feed no strategy the current server offers.

Super Signals panel

Each row is one signal the desk fired this session, with its paper result; the header totals them. A row from the watchlist view reads: 11:00 ▲ AMZN ★ poc 250h medium long • 249.60 → 250.59 / 248.60 • 66m • open.

The header

You see	It means
live · 11:10	The desk is running, and 11:10 is the last 5-minute bar it has read (CST). Amber means an agent has stalled
desk offline	The desk is not running, so the rows are as of its last run
pre-open, closed	Outside the 08:30–15:00 CST session
today, or Wed 09-24	The session on screen; a weekend shows the last trading day
4–2–0	Targets, stops and timeouts among settled signals (green, red, amber)
1 open	Signals still racing to their target or stop
+2.00R	Net R of the settled signals (see the glossary)
7 signals	Signals in the current view, each counted once, as in the daily report

You see	It means
all, open, ★ watchlist	Every signal, only those still racing, or only the watchlist tracker's hits
superbook 5, poc 18 ...	Signals per agent; tap one to show only that agent, tap again to clear

A signal row

Part	Example	Meaning
Time	11:00	The CST 5-minute bar the signal fired on
Arrow	▲ or ▼	LONG (green) or SHORT (red)
Ticker	AMZN	Tap for its quote, levels and chart
Setup	poc 250h [medium]	Agent, setup and grade; the watchlist view shows the watch's own name instead
★	★	The signal is on the watchlist
×3	×3	Several of the agent's setups fired on the same bar; listed once
Prices	249.60 → 250.59 / 248.60	Entry → target (green) / stop (red)
Horizon	66m	Minutes the signal races before it times out, flat by 15:00 at the latest
Badge	open, +1.00R, −1.00R, +0.20R	Still racing; hit its target; hit its stop; timed out at that R

A new signal gets a coloured bar on its left and flashes for 5 minutes.

Tap the setup text to open its drawer. It shows the race terms or the exit (time, price, P&L %, R), the context the agent logged, and every setup that fired on that bar. It also shows the agent, session block, source and confluence; "call ►" or "put ►" (open signals only) opens the BUY ticket prefilled.

Daily reports sit under the list. Today's pill wakes after the 15:00 report; the others open earlier reports in a viewer that steps between days and can save the page.

Best ticker + signal pairs table

Each row is one signal type with a record on one ticker over the last 30 trading sessions; the 25 strongest records are listed. They are the same rows, in the same order, as the daily report's "Best ticker + signal pairs — Last 30 days" table.

A pair makes the list when it has at least 6 settled trades in the window. The top 25 by edge are kept. The desk rewrites the list after each daily report and drops pairs that fall off it.

Columns (row 1 of the table as the example)

Column	Example	Meaning
#	1	Rank in the report, by edge
Signal	poc · poc 72h [medium] · LONG	Agent, setup, grade and direction

Column	Example	Meaning
Ticker	TSLA	The ticker this record belongs to; the same signal on another ticker is a different pair
Edge	70.1	Edge score over the 30 sessions; 50 is breakeven (see the glossary)
W–L–T	9–1–1	Targets, stops and timeouts over the 30 sessions
Win	90%	Targets ÷ (targets + stops); timeouts are left out
Net R	+8.32	Total R of the settled trades
First fired, Last fired	08-13 08:45, 09-21 14:15	First and last time the pair fired inside the window (CST); hover for the year
Today, Yesterday, Past week	0, 0, 3	Times the pair fired on the report's session, on the session before it, and over the last 5 sessions

Today, Yesterday and Past week count from the report's session, not the clock. Before 15:00 the table still holds the previous day's report, so "Today" means that day.

The line above the table reads "25 pairs · 08-13 → 09-24 (30 sessions) · written 09-24 17:15 CST": the list size, the window, and when the table was last written.

The minimums (min win %, min edge, min net R) keep only the pairs at or above each value. Leave a box blank for no limit; the line then reads "8 of 25 pairs".

Sorting: click any heading. Numbers and dates start best or newest first, text starts A to Z, a second click reverses, and # returns to the report's order. On a phone the Signal column stays pinned while the numbers scroll sideways.

The best pairs auto-trade strategy buys a live signal only when its signal type and ticker match a picked pair.

SUPERHOT (left rail)

SUPERHOT lists the large caps whose trend is just getting going: trending but not exhausted, strengthening, and one-sided. It reads the same 100-name sweep as HOT, with a faster period-9 DMI, on the bar size picked in HOT (5m by default). A row reads: NKE 35.98 · 46 · +46% · 20m · ↑.

How a name qualifies: all five gates must hold on the latest bar.

Gate	Rule
ADX(9)	Between 20 and 50: a trend, but not an exhausted one
ADX slope	ADX(9) above its value 3 bars ago: the trend is strengthening
DXS	At least 0.35 either way, where $DXS = (+DI - -DI) \div (+DI + -DI)$
Dominant DI	Above 20
DI ratio	The dominant DI is at least twice the other

When +DI dominates, the row is a call (green edge); when –DI dominates, a put (red edge).

A row

Part	Example	Meaning
Ticker	NKE	Tap for the chart; double-tap opens the BUY ticket on the row's side
Price	35.98	Last trade
ADX(9)	46	Trend strength on the period-9 DMI; hover for the exact value and slope
DXS	+46%	How one-sided the move is; +46% means +DI far ahead of –DI, and a put shows a negative figure
Time listed	20m	How long this page has seen the name on the list today; a reload restarts it
Arrow	↑	ADX(9) is rising over the last 3 bars; a falling ADX drops the name

The header shows how many names qualify (4) and, when given, the call and put split. The ↻ button forces a fresh sweep. A new name is highlighted for 30 minutes, and the panel hides when nothing qualifies.

Order: rows are sorted by the period-14 ADX from HOT, highest first, not by the ADX(9) shown. The code also defines a $|DXS| \times \text{slope}$ ranking, but the current server does not apply it.

Freshness: the sweep runs in the background about every 5 minutes in market hours. The panel checks once a minute, and every 3 seconds while a sweep is running.

HOT and CMDTS (beside SUPERHOT)

HOT is the broader tier of the same sweep: strong, one-sided trends on a standard period-14 DMI. CMDTS reads gold, silver and oil on three fast timeframes, the same board the commodity bots trade from.

HOT gates: ADX above 34, the dominant DI above 25, and the dominant DI at least twice the other. +DI dominant is a call (green), –DI dominant a put (red).

HOT shows	Example	Meaning
Count	8/100	Names passing the gates, out of the 100 scanned
5m, 15m, 30m, 1H	5m	The bar size; each choice runs a fresh sweep and is remembered per browser
ADX:+DI:–DI	68:35:3	Trend strength, then buying and selling pressure (green, red)
Ratio	11x	Dominant DI ÷ the other; ∞ when the other is zero
↻		Sweep the 100 names now

Each bar size looks back far enough for about 150–250 bars: 5 days of 5m bars up to 40 days of 1H bars.

Known issue: the long number beside the bar-size buttons (1790353063.2040377) is a raw timestamp. It should read as the sweep's age, such as "3m".

CMDTS shows	Example	Meaning
Symbol, price	GLD 393.10	The ETF tracking gold (GLD), silver (SLV) or oil (USO)

CMDTS shows	Example	Meaning
1m 31↓	1m 31↓	That timeframe's ADX; the arrow says whether it rose or fell since the last bar; the label's colour is its side (green call, red put, grey none)
C or P	C✓	1m and 2m agree on a call (C) or a put (P); ✓ means 5m agrees too
M	M	1m and 2m disagree, so there is no signal
Source	tradier	Tradier bars from 08:30 to 15:00 CST; "ninja-api" spot prices otherwise

CMDTS refreshes every 60 seconds; ↻ forces a fresh read.

Glossary and freshness

Every result on these panels is a simulated race from the signal's close to its target or stop, with no slippage or commissions. Windows count trading sessions, not calendar days, so 30 sessions is about six weeks.

Term	Meaning
R	Profit or loss divided by the stop distance: +1R is the target, −1R the stop, a timeout lands between
Timeout	Neither target nor stop was hit within the horizon or by 15:00; the trade is marked at the last close
W–L–T	Targets, stops and timeouts
Win %	Targets ÷ (targets + stops). Timeouts are left out, so read it beside W–L–T
Edge score	The 80% lower bound of the credit rate × 100: target 1, stop 0, a timeout by its R. 50 is breakeven; a few lucky hits cannot outrank a long record
Source	live: logged in real time. catchup: the desk started late and caught up. backfill, reconcile: rebuilt from bars afterwards
DMI, +DI, −DI, ADX	Wilder's directional movement: +DI is buying pressure, −DI selling pressure, ADX trend strength (0–100) either way
DXS	$(+DI - -DI) \div (+DI + -DI)$, from −1 to +1: how one-sided the move is
0DTE	A contract that expires the same day

Numbers	When they change
Super Signals rows	A signal appears a minute or two after its 5-minute bar closes; outcomes settle as later bars arrive
Daily report	Written at 15:00 CST; a 15:45 run writes it if the first one missed
Best pairs	Rewritten after each report; until then the previous day's list
SUPERHOT, HOT	Re-swept about every 5 minutes in market hours
CMDTS	Every 60 seconds
